IMPORTANCE OF MILK

Fresh Milk, Proteins and Frothability

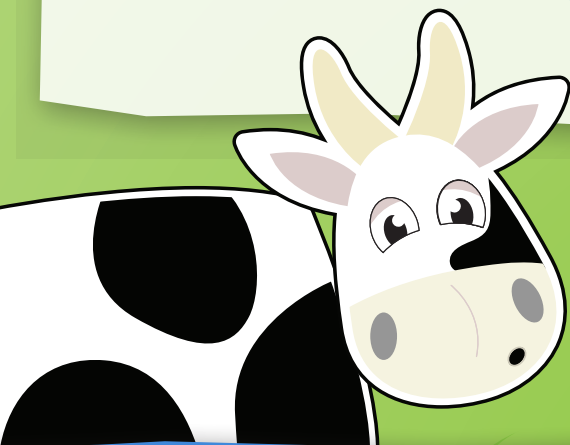

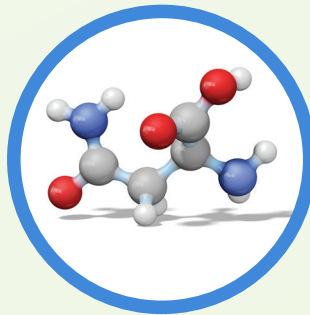

Milk contains **3.3% total protein**, all **9 essential** amino acids for human dietary requirements.

Frothing occurs through the denaturing of proteins in milk.

Denaturing of proteins is the breakdown in structure by application of external stress (**STEAM!**)

Over time milk proteins degrade by the break-up of links between amino acids, reducing frothability.

Our **6 day** delivery service and **7 day shelf** life guarantee, ensures the freshest milk for frothy coffee.
